MultiFactor Authentication (MFA)

Multifactor Authentication (MFA) is the superhero of digital security, the impenetrable fortress guarding our online identities. In a world where passwords alone can no longer be trusted, MFA can save the day adding an extra layer of protection that keeps hackers at bay.

The following statistics are taken from CrowdStrike's 2023 Global threat report

81% of hacking-related breaches are due to weak and/or stolen passwords

38% of large organisations and 62% of small - medium organisations still don't use MFA

MFA blocks 99.9% of modern automated cyberattacks

MFA blocks 96% of bulk phishing attempts
